Q: Почему регулярное выражение не работает? Проверяю квадратную кнопку ввода в поле. Есть регулярное выражение, чтобы проверить набор из приведенных изображений (ну что-то в таком роде): `var x = new Regexp(@"[a-zA-Z]*(?:[^\-]|d+|[^\-])\d+\.?d+")` Почему-то вместо изображения "123+-4.5" или "0.0023+4.5" набор вводится всё напрасно. А: Старайтесь воспользоваться более правильными синтаксисами. []* Поддерживает: 0 любых символов (пустая регулярка) Только не захватывающие: [0-9]{3} Под

Q: linux server logout completely using shutdown command I want to logout my linux server completely and manually. When i try to logout using shutdown command, it logout the server smoothly but my screen remains un-responding. Is there any way to logout the server without halting the system. Here is the code which i have used. `shutdown -h now -p A: shutdown kills the process itself, it doesn't 'logout', unless you have a screen which is not kept and you need to logout of it. If your graphics driver has a background system redirection, it will remain in a terminal, but not on screen. If you want to fully kill the process(es), use kill -9 . Since you are unable to manually control your machine, you can have a shell session open at the time of shutdown, as well as screen/tmux sessions. Having a shell session open at the time of shutdown is not recommended, as it will interfere with the shutdown process, as the shell is executed at the last moment. The following will logout completely in the best possible manner, so you can watch for any process that isn't killed in the process: shutdown -h now -p # /etc/init.d/bootlogd start # tmux -S hello # sleep 2 # /etc/init.d/bootlogd stop # tmux -S bye This is the process: The shell sessions is kept (in addition to /var/log/boot.log) for debugging any problem as you see fit. Once tmux is done, the shell session is disabled. bootlogd gets launched and monitors for shutdown (this process gets invoked in case there are any problems or shutdown has to be forced). Once the /etc/init.d/bootlogd exit command is executed, the shutdown process is halted. Q: Why is my scala app very slow? I'm a very novice Scala programmer and I'm trying to write a simple calculation/decimal-to-binary converter application in Scala. It's extremely slow. It runs this block of code, like this, for about 10 minutes before I stop it: println(longitude + " " + latitude) class Geometry(latitude: Float, longitude:`
