...Q: Programming languages for developing an e-commerce site I am trying to develop an e-commerce site, but I can't decide on a programming language to use. I'm an experienced developer, and have done my fair share of java, python and ruby, but I feel that I don't know much about languages such as PHP, C# and VB.NET, or web services. I want to develop the site using php, but I don't want it to get overly complicated. Could you recommend a language which is not very difficult for me to learn? Also, do you have any tips as to choosing a technology for an e-commerce site, and do you have any tips for making it search engine-optimised? I am currently using Wordpress as a CMS. Many thanks. A: Since you have listed multiple languages, I will approach your question as best as I can in general and cover the languages you've listed. PHP is a great language that is easily used for e-commerce websites. Its major flaw is that it often seems not to be object-oriented. So, if you are more comfortable with OO programming, then you should probably go with a language such as Java or C#. It's pretty easy to get a good grasp on the language if you know Java. C# is an OO language just like Java. So you could probably learn it quite quickly, too. If you want to target the .NET Framework, that means you will be developing in a somewhat different environment than PHP. .NET is common for ASP.NET applications and is more object-oriented than C#, however. Once you get comfortable in an OO language, try to go for .NET. It is very easy to transition to Java once you get comfortable with .NET. That's what I would recommend. If you are very comfortable with OO languages, then you can go for Java. In order to create the MVC architecture needed for web development, you need to be comfortable with OOP. For something as simple as an e-commerce system, Java isn't necessarily needed. I don't think it would be a huge problem to learn Java. As I recall, the IDE is very easy to use and you can probably get a good grasp on how Java works from the tutorials. It is also fairly easy to get comfortable with.

This is a common problem for these files. If you are experiencing this. radiant dicom viewer cracked v 6.5.Q: Is the central character of "Shakespeare in Love" considered a 'Lover' or a 'Wife'? It seems like Shakespeare in Love is the only film that fails to make a clear cut between a "Lover" and a "Wife". At first, I was under the impression that William Hart is a "Lover". But then, I realized that he is just as one-sided as the "Wife", and that he seems to be as possessive and controlling as Rosaline, a character often considered a "Wife" in that Shakespeare's sonnets were really addressed to her. Is it because there is a "Vagina" scene in the film? A: I have seen both the film and the play. Shakespeare's Willy in the film is that passionate, possessive character who is easily hurt and who loves deeply. Willy in the play, however, is that clever, witty character who is in love with Rosaline. He is mocked frequently by Prospero and his companions, who have problems of their own. /* * Copyright (c) 2018, 2019, Oracle and/or its affiliates. RadiAnt DICOM Viewer enables users to make use of the array of multi-touch .Q: Resize JScrollPane to height of JFrame I have a JFrame that is 617 pixels high. When the JFrame is resized, the JScrollPane component does not get resized so it remains at the same size, even when the frame's height is reduced. How can I get the JScrollPane to fit the size of the JFrame? A: As stated in comments by @Chris, JScrollPane is designed to wrap a container inside which contains your content (refer JScrollPane tutorial for more). If you want to have a scrollable pane, you can wrap the JScrollPane inside another component (panel or JPanel) that will have the size you want to. If you want to have the size of the panel to be the size of the JFrame, you need to set the layout of the panel to BorderLayout and then add the scrollpane on the right JPanel panel = new JPanel(); panel.setLayout(new BorderLayout()); // or without parameters, with BorderLayout layoutManager = new BorderLayout(); // panel.setLayout(layoutManager); panel.add(scrollpane, BorderLayout.LINE_END); A: You can set the preferred size of the scroll pane (and the scroll pane will use the size of the parent container as a reference). However, the scroll pane will not change size automatically if the container expands or shrinks to adjust the content it contains. A: A good way to do it is to wrap the JScrollPane inside a JPanel and set the layout of the JPanel to BorderLayout. Then
