Anthropometric, clinical and developmental data on children with cryptorchidism were collected to assess, if cryptorchidism, in and of itself, is associated with a subtle, subclinical delay in neurodevelopment. A group of 105 cryptorchid boys and 24 boys with inguinal hernia were matched for age, race and social class. Anthropometric measurements included weight, length and head circumference. Motor and mental development scores were obtained for all children. The mean age of the total population of children (M = 3.8 years) was not different from that in the inguinal hernia group (M = 3.8 years). In the cryptorchid group, mean head circumference was consistently smaller than the hernia group throughout the age range studied. When individual anthropometric measurements and head circumference were compared between groups, significant differences were found in weight and length for age and weight for length. When clinical and developmental scores were compared in the two groups, significant differences were found in the cognitive/language tests. There was a significant negative correlation between head circumference and age in the cryptorchid group only. These data indicate that cryptorchidism is not associated with a developmental delay in the majority of cases, and that the presence of cryptorchidism, in and of itself, does not have a deleterious effect on the development of children. Advocacy-driven expansion of public health measures in the 1990s: the case of prenatal care. The rapid expansion of health care coverage in the United States during the 1990s is often portrayed as an unprecedented achievement in achieving universal access to health care, the "end of welfare" and a new "Age of Austerity." Yet from a historical perspective, the current wave of health care reform is merely the latest stage in a decades-long revolution that began in the early 1970s as the United States shifted its economic and social foundations away from a once expansive Welfare State toward a minimalistic safety net. This essay argues that the "Age of Austerity" has been joined by an "Age of Advocacy," a moment when the scale of the US public health establishment has finally grown large enough to support unprecedented policy interventions. The recent emergence of "public health advocacy" as a
