Features Wondersoft Virtual PDF Printer. Creating PDF documents is easy when you use the Wondersoft Virtual PDF Printer. Virtually every aspect of the PDF document creation process is automatic or quick. Virtually all files and layouts can be imported or exported, too.

Q: How to use escape code with format.js? I'm trying to use escape codes with my formatter and I'm having problems: createResult: function(model) { var \_format =

---

`format.format(model.get('date'), {  
 human: true }); return _format; }`  
where "date" is the field name and  
"human" is the field value. I know it's  
a text value but my record contains  
quotes so I can't display it as it is. I  
tried using ES6 function object, and  
`String.raw: return String.raw`The`

format is:

`${model.get('date').escape()}`;` but it  
doesn't work.. I also tried this:

`createResult: function(model) { var  
 _format =`

`format.format(model.get('date'), {  
 human: true }); return String.raw`The  
format is: ${_format}`; }` but it gives  
me an error saying: Cannot read

---

property 'escape' of undefined. A: You should use a formatted value as a string. return  
format.format(model.get('date'), {human: true}); Please check this: As @viper54 said in the comments Q: how do i put the count in select statement i have a mysql database with 4 tables listings
