To stay on top of printer drivers and other software updates, and to receive notifications of software and driver updates that can potentially affect printer operation, users are advised to use Microsoft Device Manager. To update a driver listed in Device Manager, click the tab corresponding to the driver you wish to update, then click the Update Driver button. Some models of printers do not require the installation of drivers. In such a case, the operating system automatically identifies the printer and communicates with the print head and the print engine to select the proper operating mode.

Microsoft® Device Manager can still be used to install drivers for a printer that doesn't require drivers to be installed, but only the "Manufacturer or vendor provided" drivers can be installed. If you do not receive any of these automatically installed drivers, the drivers you need are most likely installed on your computer by other

means. To receive notification of software and driver updates that can potentially affect printer operation, users are advised to use Microsoft Device Manager. To update a driver listed in Device Manager, click the tab corresponding to the driver you wish to update, then click the Update Driver button. In a subset of enterprise printers, the built-in operations system is used to manage critical functions such as extended maintenance and firmware updates. This may also be done from a management point of view for MS Windows systems. If the printer's service manual fails to give adequate information on where to locate the error codes or messages, you may be able to find the codes, messages, and error numbers on the printer's thermal printhead camera, which typically displays what is going on with the printer. The location of the camera and how to access it may vary from printer to printer. You may also be able to access the camera or its

photos and view the error codes,
messages, or numbers yourself.
