

## Bbs Climawin

the climawin engineering consortium, comprising three of the original seven project partners, is a not-for-profit organisation based in denmark and germany. it was established to commercialise the technologies developed during the eu-funded research project. its aims are to: • to raise awareness among the general public of the need for reduction of energy consumption, at the same time, climawin will support the green economy by stimulating investment in smart building and green energy technologies. • to encourage companies to develop and implement the technologies that exist, apart from the obvious benefits to consumers, companies will also benefit from the improved energy efficiency, thus reducing energy costs. • to address technical challenges that prevent commercialization of the technology, a challenge of many technology development initiatives is to bring the technology from the lab to the point of ready-for-marketability. the consortium has already reached that stage and is therefore well placed to develop commercialization activities. the consortium expects to have a ready-for-market climawin product available in late 2014. nick perrin, managing director of climawin engineering consortium, said: "we have reached a milestone in climawin's development. what we have is a proven product ready for full commercialization. we are the first to have a ready-for-market version of a climate-control technology that will cut energy costs by 65% or more. this is commercial and growth technology." climawin windows will be initially available in sizes of 40 mm to 700 mm, priced at around €5,000 to €10,000 per window. owners will be able to retrofit the windows into existing windows using existing mounting technology, with no rewiring or new glazing required. in 15 years, per-house prices for high-performance windows are expected to be around €2,000 to €3,000, but it is not currently possible to predict whether climawin prices will be competitive with windows and air-conditioners that use the sun and fresh air to cool and heat buildings.

## Bbs Climawin

berlin, germany, 25 august 2013: the european commission has made more than €29 million available over four years in the framework of the eu research and innovation programme horizon 2020 for new renewable energy sources in buildings. the climawin project (<http://www.climawin.eu>) is one of those that has been selected. the successful collaborative project between four partners from four eu member states (denmark, germany, ireland and portugal) has already received a grant for more than €5.5 million. climawin is financed from the 7th, 8th and 9th research and innovation framework programme. the project is in its second research and development phase, which is expected to last until the autumn of 2013. successful completion is dependent on finalising a contract for the manufacturing of the climawin ventilation windows with the company trädgårdens hus ([www.tradgardenshus.se](http://www.tradgardenshus.se)). with climawin and the continued growth of solar energy we also promote the use of the most efficient and sustainable source of energy and replace the use of oil and fossil fuels. this will further contribute to global sustainability. climawin is energy neutral and does not require energy to operate and has a very long service life. we are thrilled about the prospects for this technology and are looking forward to commercial launch and to seeing our friends in the industry stand together and make this a success. we are therefore looking forward to meeting with them in the near future and thank them for the effort and support that they have given us. the consortium is currently negotiating licenses with licensees, to allow them to build and sell systems in their respective markets, and also to negotiate with developers who will be willing to build their own windows using this technology. 5ec8ef588b
